WorkRadar: Product Requirements Document

A daily view of work for product managers | Pravarsha - Airtribe AIPM - Cohort 40

1. Problem Statement

Product managers get work from many places at once. Engineers ask questions in Slack. Bugs and launch tasks sit in Jira. Pull requests wait for product approval in GitHub. Customers, sales and leaders write in by email. Every morning a PM has to open all four tools just to figure out what matters. The biggest problem is easy to miss: someone on the team is often stuck waiting for the PM to make a decision, and the PM does not notice because the request is buried in a long thread. WorkRadar brings everything into one list, sorts it by what matters most, explains why, and gives a short daily summary written by AI. The PM can act on each item right there.

2. Target Users

Main user: a product manager who owns one product area and works with a team of 4 to 10 engineers, using Slack, Jira, GitHub and Gmail or Outlook. **Other users:** heads of product who manage several PMs, and associate PMs who are still learning how to prioritise.

3. User Personas

Persona	About them	What they want	What frustrates them
Ananya Rao, Senior PM, Checkout (main persona)	Team of 6 plus a designer and an analyst. A big launch is 6 days away. Gets around 180 Slack messages, 25 Jira updates, 12 PRs and 50 emails a day.	Keep the team moving, ship the launch on time, and answer leaders with real facts.	Finds out in standup that an engineer waited two days for her answer. Customer emails get lost. Status updates eat her evenings.
Vikram Sethi, VP Product	Manages 5 PMs. Has a weekly leadership meeting.	Hear about risks early, without chasing people.	Learns about problems too late.
Rohit Jain, Associate PM	New to the PM role.	Understand what to work on first.	Treats every message as urgent and misses the important one.

4. User Journey: a normal morning

Step	Today, without WorkRadar	With WorkRadar
Getting started	Opens Slack, Jira, GitHub and email one by one. Takes 35 to 50 minutes.	Opens the Today page and reads a short summary of what to do first, who is stuck and what changed. Takes about 2 minutes.
Helping the team	Scrolls back through Slack to find what Arjun asked, then replies.	Clicks Decide now, picks an option, adds a note. Arjun is no longer blocked.
Replying to leaders	Pieces together an update for the VP from memory.	Opens the item and asks Claude for a short update and a draft message.
Tracking the launch	Updates a spreadsheet checklist by hand.	The launch checklist updates on its own as items are finished.
Clearing the rest	Leaves tabs open as reminders.	Assigns, snoozes or marks items done, and can undo. Can search everything in one place.

5. Key Pain Points

- **The PM becomes the blocker** without knowing it, because decision requests get lost in threads.
- **Everything looks equally urgent.** A customer losing money and a small copy edit show up the same way.
- **Too much switching** between four tools and hundreds of updates before real work starts.
- **Launch status is hard to see.** The checklist is out of date as soon as it is written.
- **Status updates take hours** because the PM has to pull information together by hand.

6. Success Metrics

Main metric: how many hours teammates spend waiting for a PM decision each week. We want this to go down.

Metric	Starting point (my estimate)	Goal after 8 weeks
Time from opening the app to the first action	35 to 50 min	Under 3 min
Average wait for a decision from the PM	About 26 hours	Under 6 hours
Share of summary items the PM acts on	Not tracked yet	45% or more
PMs who agree with the top 5 order (thumbs up)	Not tracked yet	80% or more
PMs using it every week / still using it after 30 days	Not tracked yet	70% / 45%
Wrong facts reported in the AI summary / data delay	Not tracked yet	Under 2% / under 5 min

7. MVP Scope

Included: sample data from Slack, Jira, GitHub and Email in one common format; a clear priority score with the reasons shown; an AI summary with a backup summary if AI is not available; the Today page; a priority feed with 13 filters; search; an item page with a decision picker, AI suggestions, the original conversation and related items; Assign, Mark done, Snooze, Nudge and Undo; a launch checklist; empty and error screens; keyboard and mobile support.

Not included yet: live connections to the real tools, updating the source tools from WorkRadar, notifications, mobile apps, views across many PMs, custom scoring and reports.

8. Assumptions

- PMs will connect their tools if we only ask to read data and keep it for a short time.
- Decisions that block teammates are the most important thing for a PM to see first.
- PMs will trust a score more if they can see how it was calculated.
- Recording actions inside WorkRadar is enough to prove people find it useful, before we build updates back to Jira or Slack.
- AI costs stay low because the AI only runs when the PM asks for it.

9. Features: Must have and Nice to have

Must have (MVP)	Nice to have
Today page that answers the four main questions	Ask Claude in search (already built)
AI summary that links each line to its item	AI next step and draft message (already built)
Priority feed with reasons and filters	Nudge messages for outside blockers (already built)
Who is blocked, with a separate group for blocked on you	Update Jira, Slack and GitHub from WorkRadar
Decision picker that unblocks a teammate	Morning summary sent to Slack
Item page with the conversation and next step	Weekly update for leaders
Assign, Mark done, Snooze and Undo	Thumbs up or down to tune the ranking
Search with @person, source: and is: filters	View across many PMs
Launch checklist	Calendar and customer feedback as sources
Empty, error and reconnect screens	

10. How the Priority Score Works

Each item gets points for: how serious it is (critical 40, high 26, medium 14, low 5), being due today (20) or tomorrow (11), a teammate being blocked on the PM (16) or blocked by someone else (10), each item it is holding up (5), customer impact (10), money at risk (6), waiting on the PM (9), being part of a launch in the next 7 days (5), and being open for more than 2 days (5). The top score is 99. Anything at 60 or above needs attention now. The AI only writes the summary from this list. It does not change the order.

11. Risks and How We Handle Them

Risk	What we do about it
The AI summary gets a fact wrong	Each line links to the real item, made up item IDs are removed, and there is a backup summary.
Security teams say no to connecting tools	Read only access, the PM picks which tools to connect, data is kept for 30 days at most.
The order does not suit a team	Reasons are visible now. Thumbs up or down and custom weights come next.
